

# Introducing OpenMx

Michael C Neale  
Virginia Commonwealth University

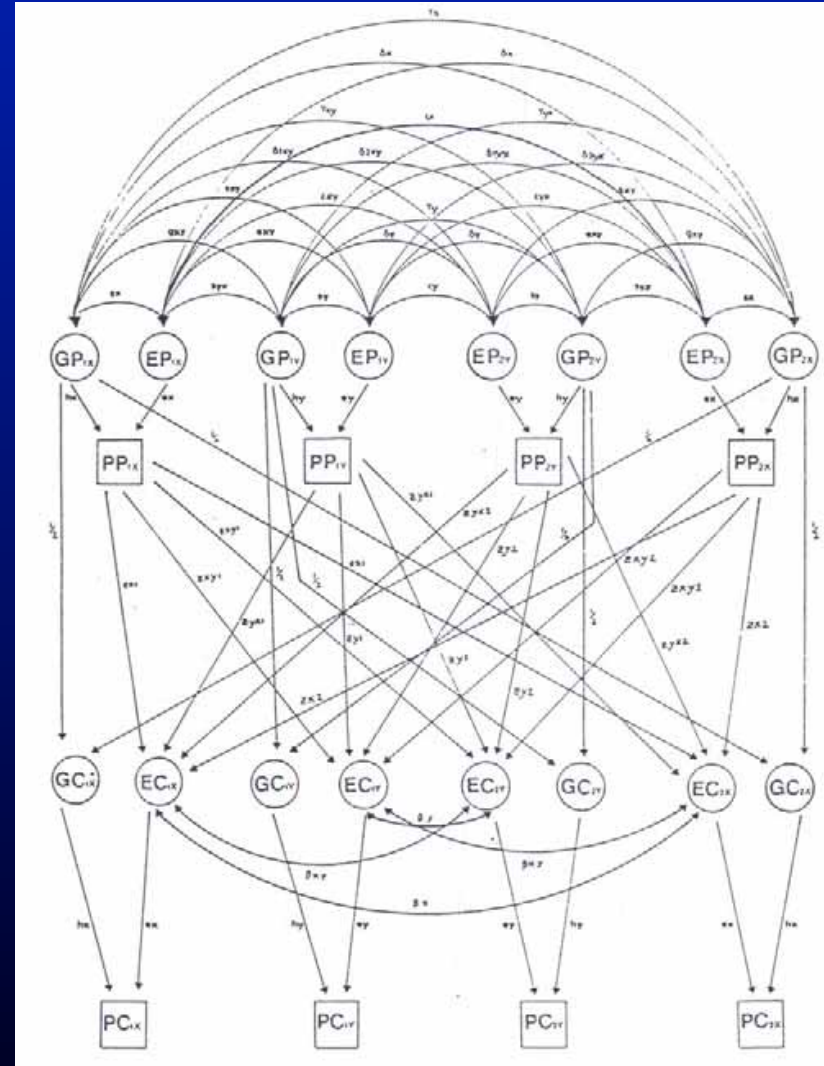

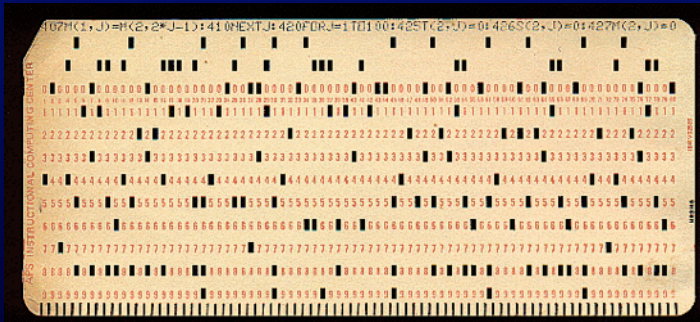

Boulder Workshop 2012

# Overview

- History of Mx and OpenMx
- Description of OpenMx Structure
- Introduction to mxMatrix and mxAlgebra commands

# MCN background

## Prehistoric Beginnings

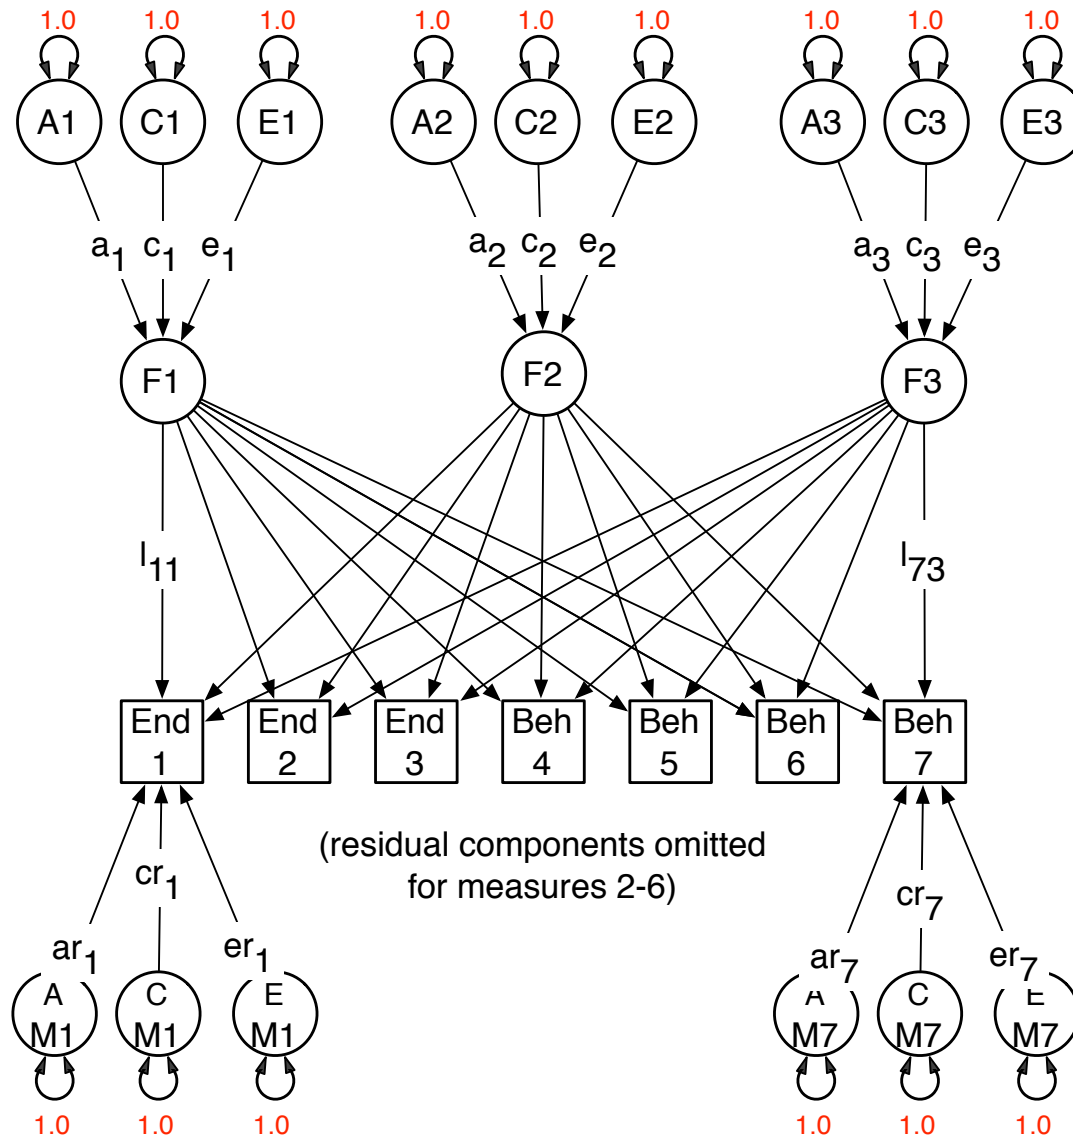

# How did OpenMx get started?

- Twin Methodology Workshops 1987-1989
- Use of LISREL
- Limitations of LISREL, EQS et al
- Experience with Optimization & Matrix Algebra & Calculators in FORTRAN
- January 1990: start connecting matrix algebra interpreter with numerical optimizer

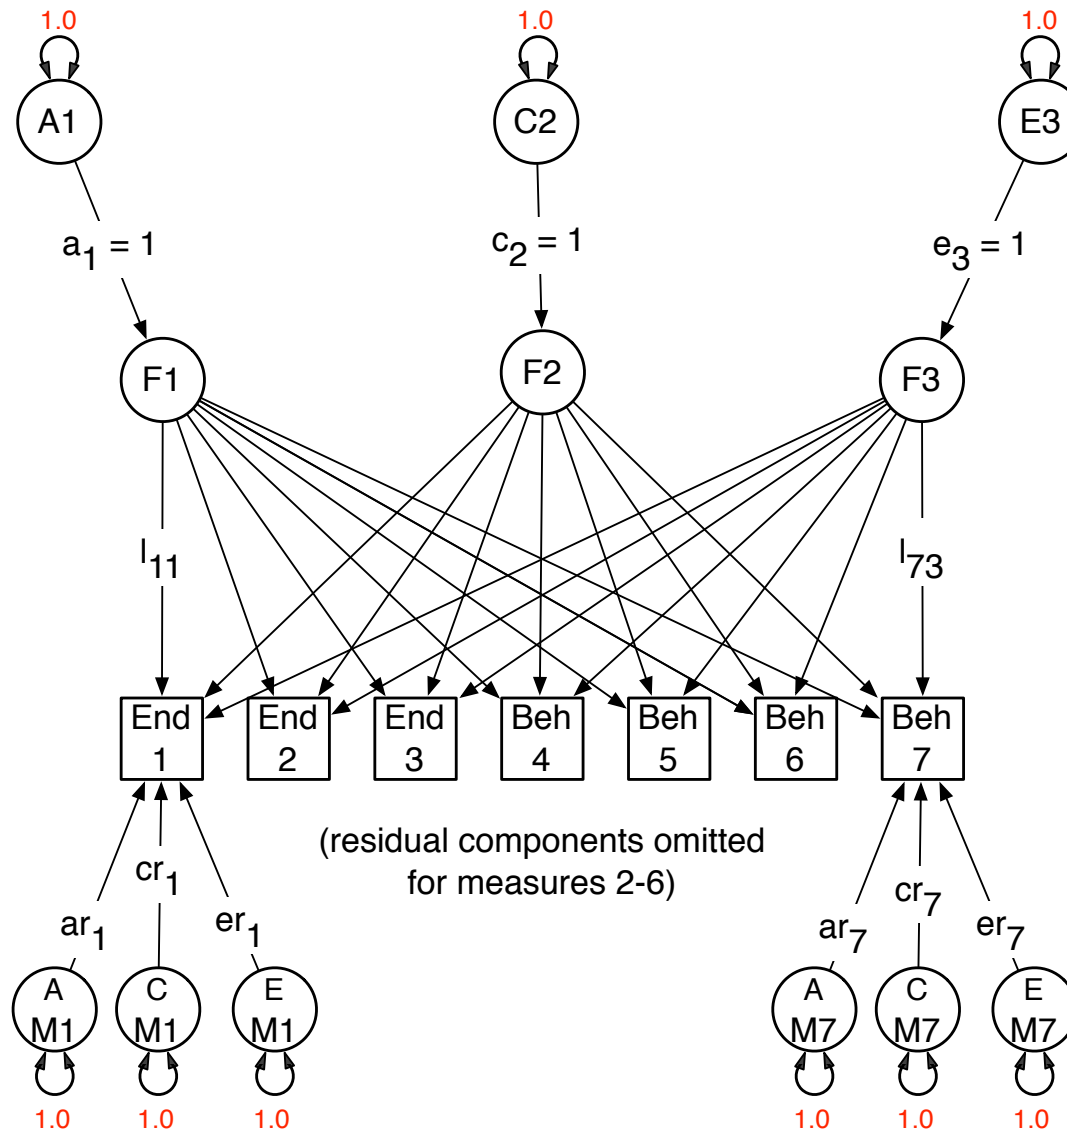

# Motivation for Mx & OpenMx

- Wide variety of models
  - Univariate Twin ACE ADE
    - Continuous Data
    - Binary/Ordinal Data
  - Multivariate
    - Saturated (e.g., Cholesky)
    - Biometric Factor
    - Psychometric Factor
    - Direction of Causation
    - Comorbidity Models, Endophenotypes
  - Extended Pedigrees, Adoption, Twin-Family

# Psychometric Factor Model

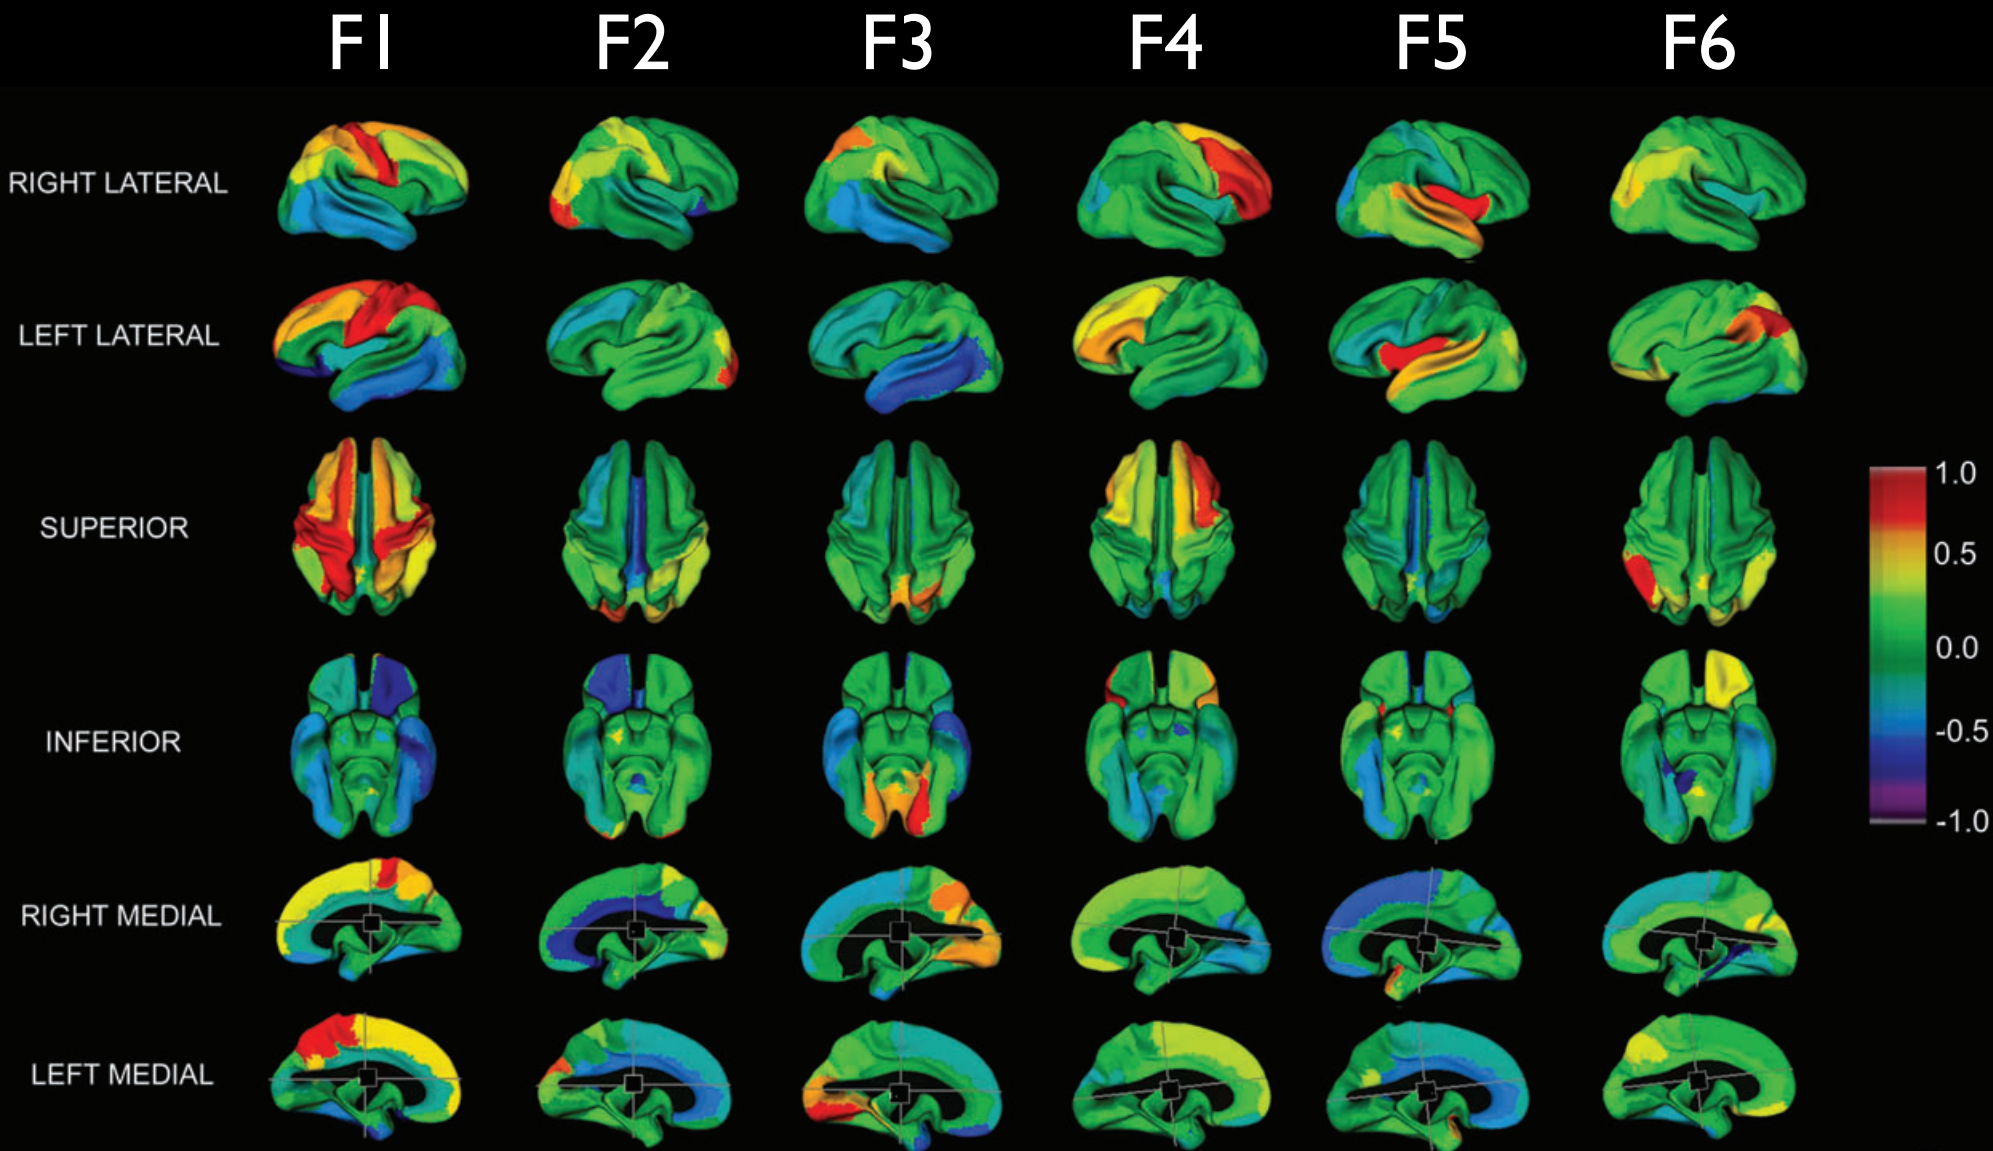

# Biometric Factor Model

Independent pathway model is submodel of 3 factor common pathway model

# Genetic Factor Loadings

B

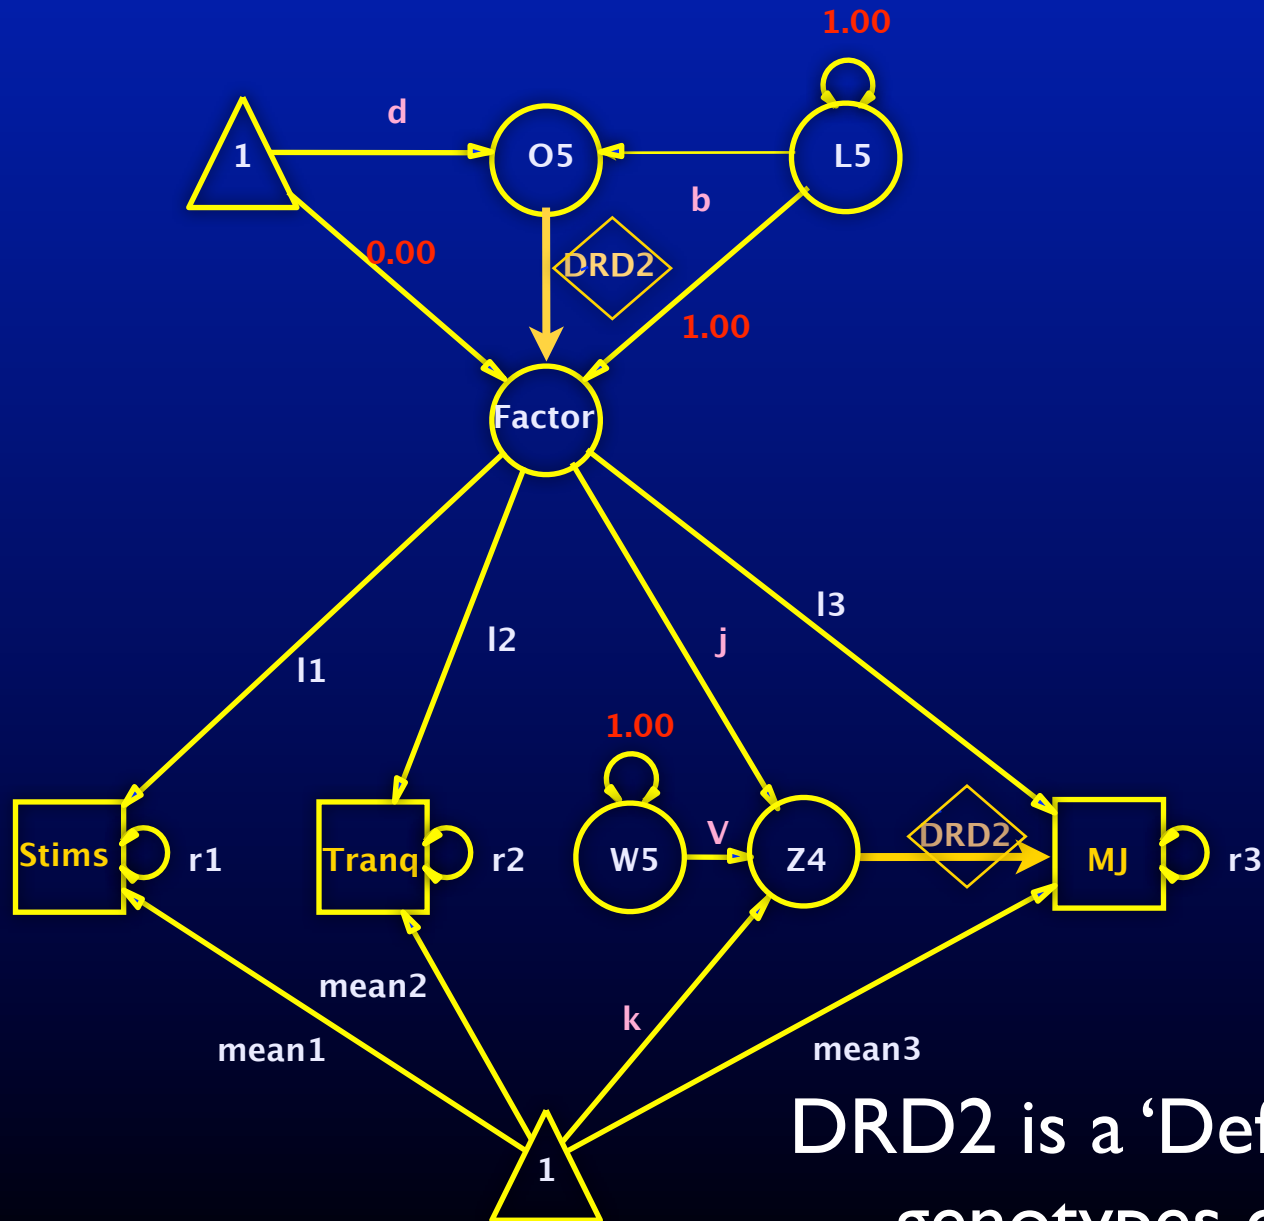

# Motivation for OpenMx II

- Interactions
  - Heterogeneity, Meta-Analysis
  - Sex-limitation, C/G×Sex
  - Measurement Invariance & IRT
  - Continuous & discrete moderators
- Mixture Distributions
  - Twins: Uncertain Zygosity (Neale 2003)
  - Linkage: Uncertain IBD
  - Association: Uncertain Haplotypes/Genotypes
  - Latent Class & Factor Mixture Models

# Estimated Nicotine Dependence Item Characteristic Curves for 20-Year-Old Females

# DRD2 in the Factor Model

DRD2 is a 'Definition Variable'  
genotypes coded -1 0 1

# Motivation for Mx & OpenMx III

- Missing Data
  - Longitudinal Studies
  - Conditional Models (initiation & dependence)
- Dynamical Systems
  - Latent Growth Curves
  - Dampened Oscillators
- Multilevel Modeling
  - School/Batch Effects

# More Information

- Published articles & book chapters
  - <http://www.vipbg.vcu.edu/neale-articles.shtml>
- OpenMx website
  - <http://openmx.psyc.virginia.edu>
- Dutch classic Mx website
  - <http://www.psy.vu.nl/mxbib>
- Original Mx website
  - <http://www.vcu.edu/mx>

# What's wrong with Classic Mx?

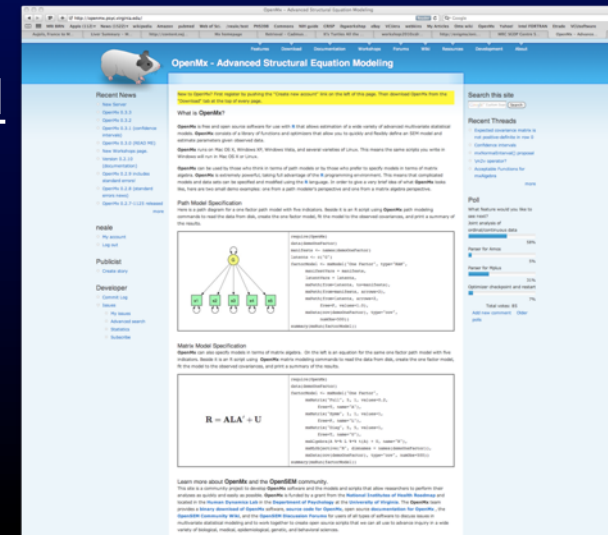

- Single programmer
  - Limited Tech Support
  - Limited Life
  - Limited Feature Enhancements
  - Limited Interoperability
- Spaghetti Code
- Idiosyncratic Positional-Dependent 'Specialist' Language
- Single Letter Matrices

# What is OpenMx?

- Free, Open-source, full-featured SEM (XSEM) package
- Software which runs on Windows, Mac OS-X, and Linux
- A package in the R statistical programming environment

# What Does OpenMx Offer?

- New approaches to model specification
- Path-style and matrix-style scripting
- Web-based forums, tutorials, and a wiki
- <http://openmx.psyc.virginia.edu>

# Why Open Source?

- Community–based approach to software development
  - More people can work on its development
  - Code can be inspected and edited by anyone
- Scientific model
  - Acknowledge work of others
  - Contribute effort for the benefit of all
- Apache 2.0 license

# Language Fundamentals

- R is a functional language
  - Easy to define new functions
  - Not strictly functional - some interactions
  - Everything is an Object
- OpenMx uses functions to build objects
  - `mxModel()` is a function
  - Arguments have an order
  - Order can be changed by naming arguments

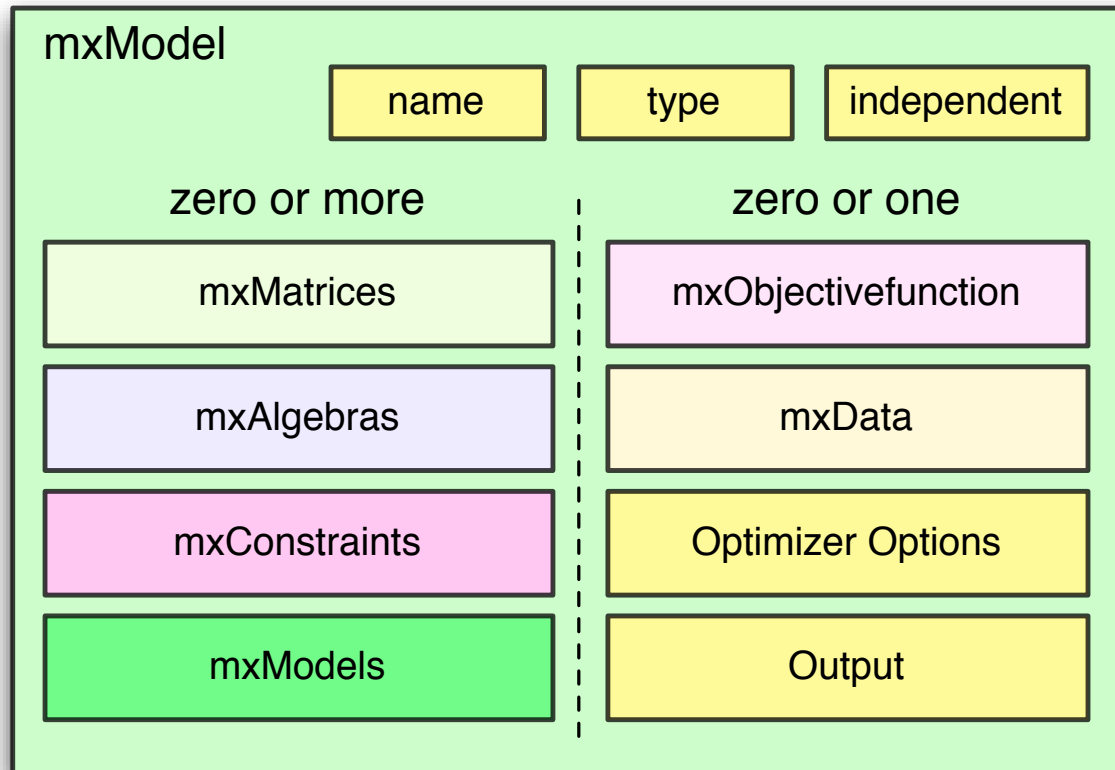

# OpenMx Essential Functions

- `mxModel()`
- `mxMatrix()`
- `mxAlgebra()`
- `mxData()`
- `mxFIMLObjective()` [*+ mx\*Objective()*s]
- `mxRun()`

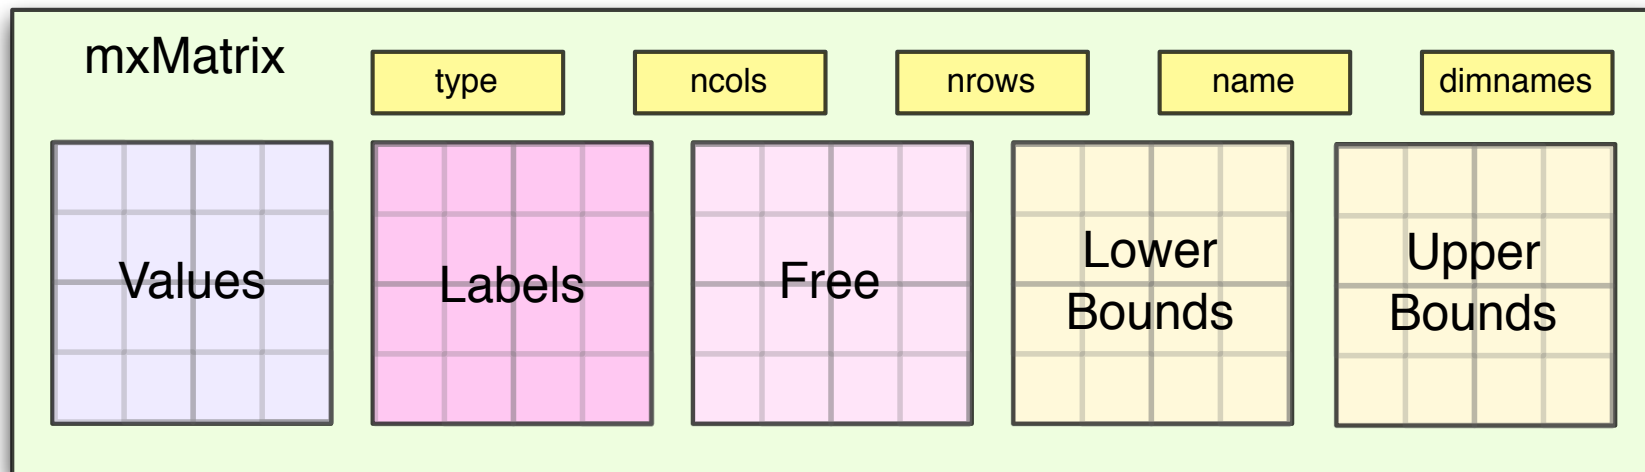

# OpenMx Utility Functions

- `mxOption()`
- `mxRename()`
- `mxEval()`
- `mxConstraint()`
- `mxPath()`
  
- Several others + any you make yourself
  - `plus2 <- function (x) {x+2}`

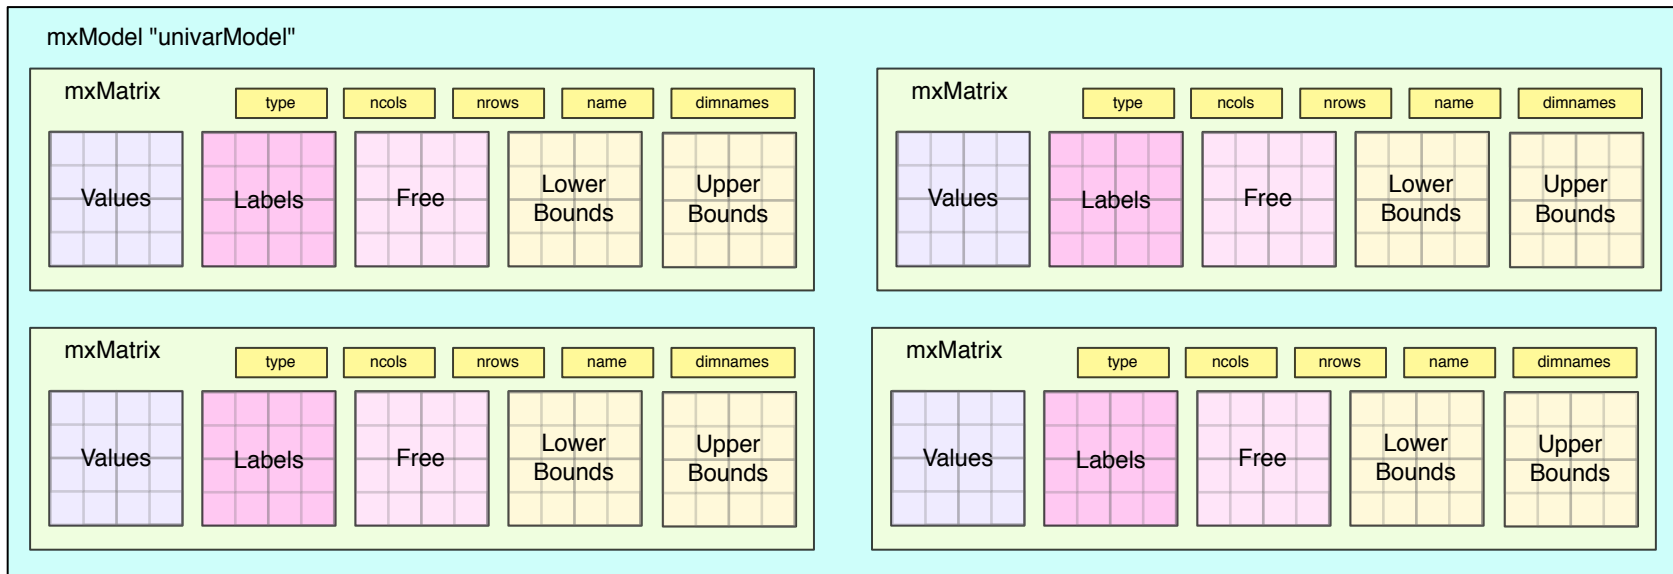

# An MxModel Contains Objects and Other MxModels

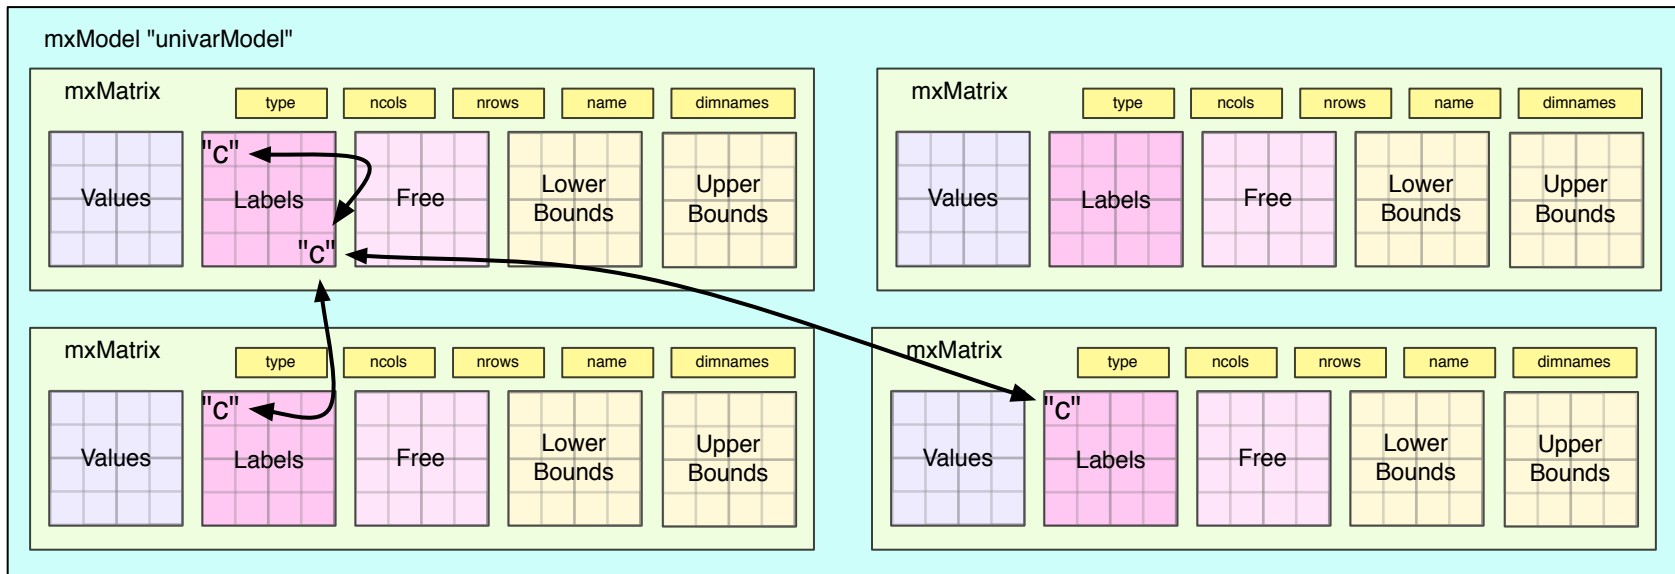

# An MxMatrix Contains Values and Metainformation

# Many MxMatrices Can Be in an MxModel

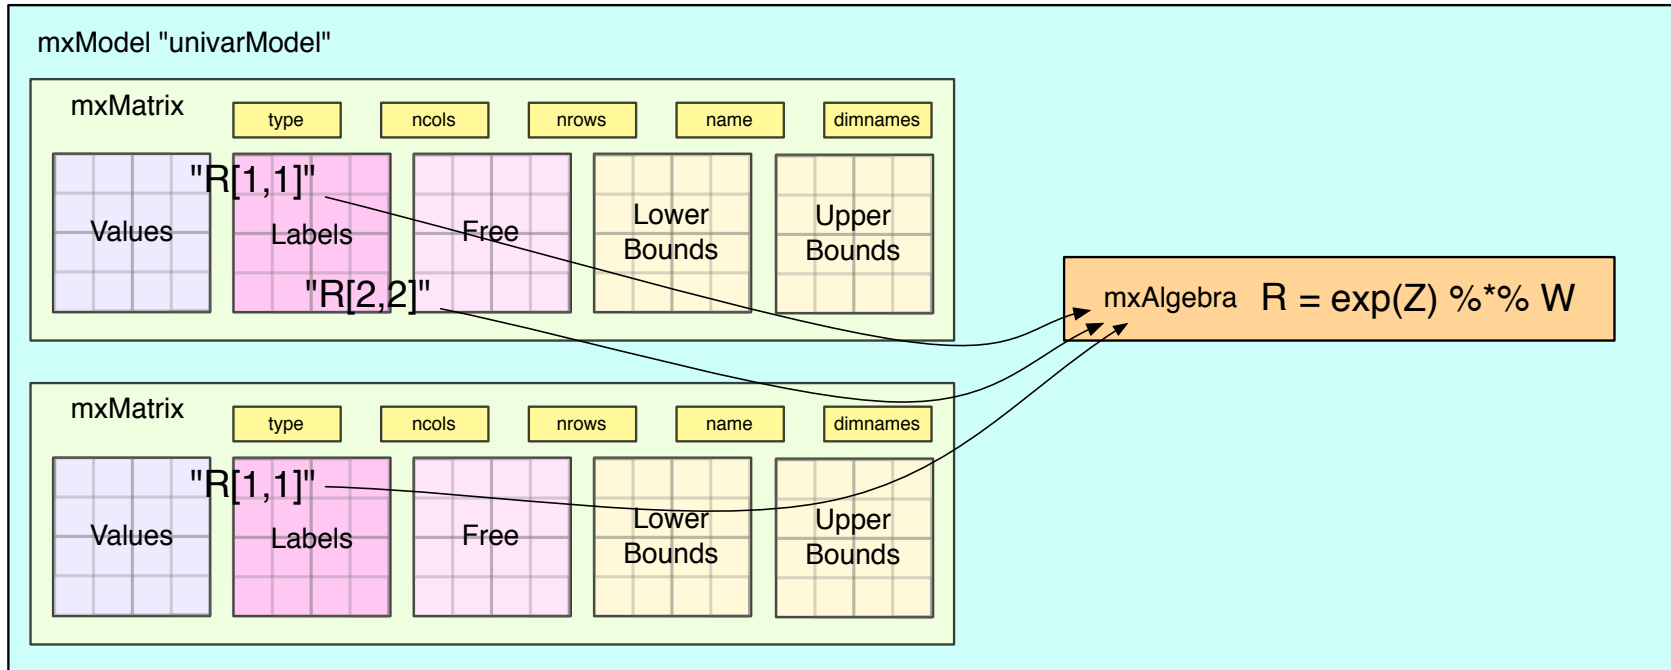

# Labels Can Be Used For Equality Constraints

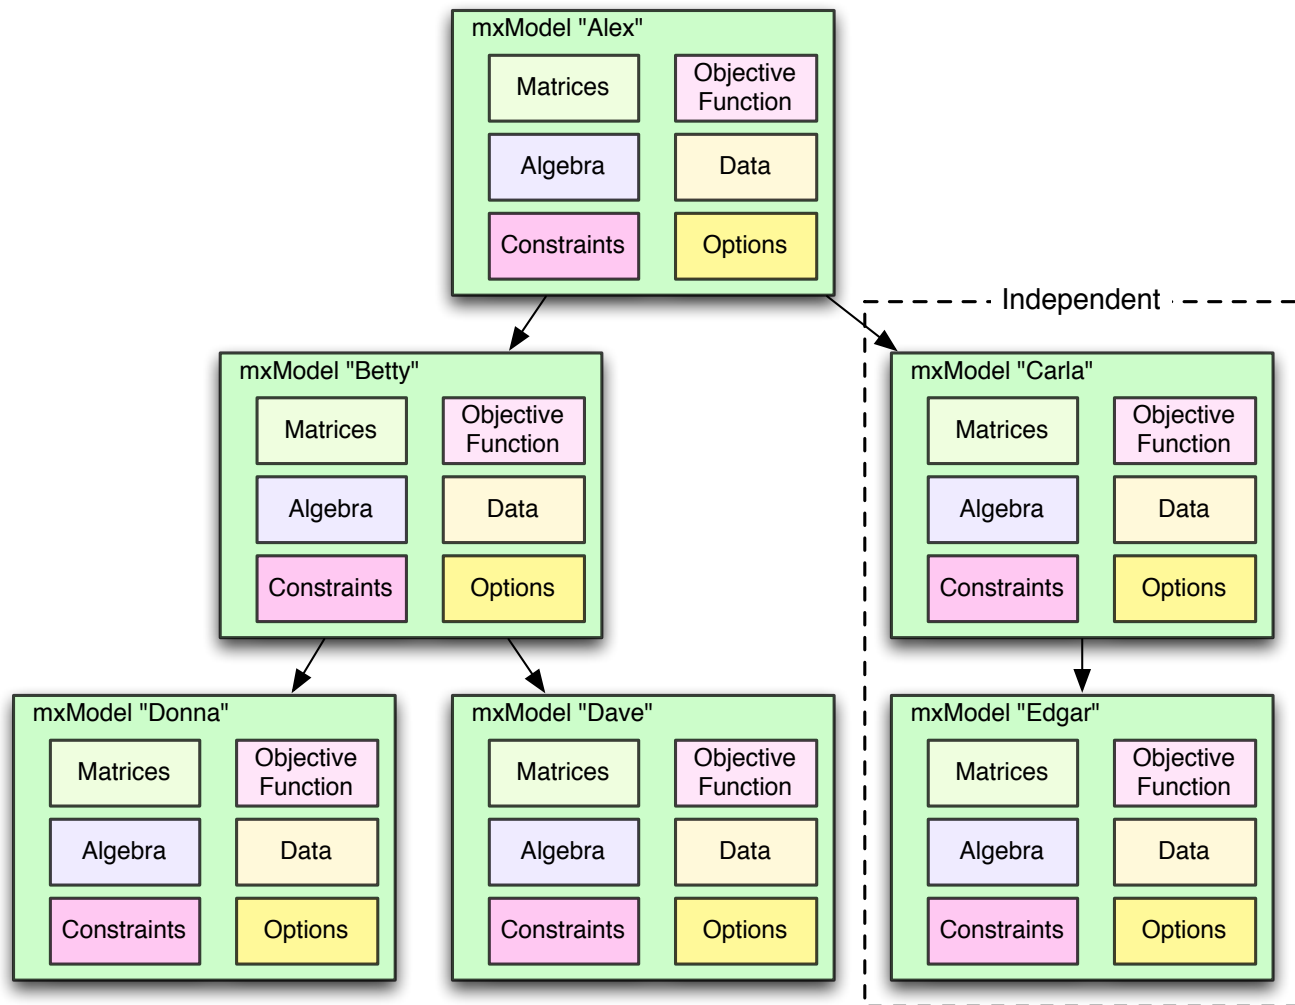

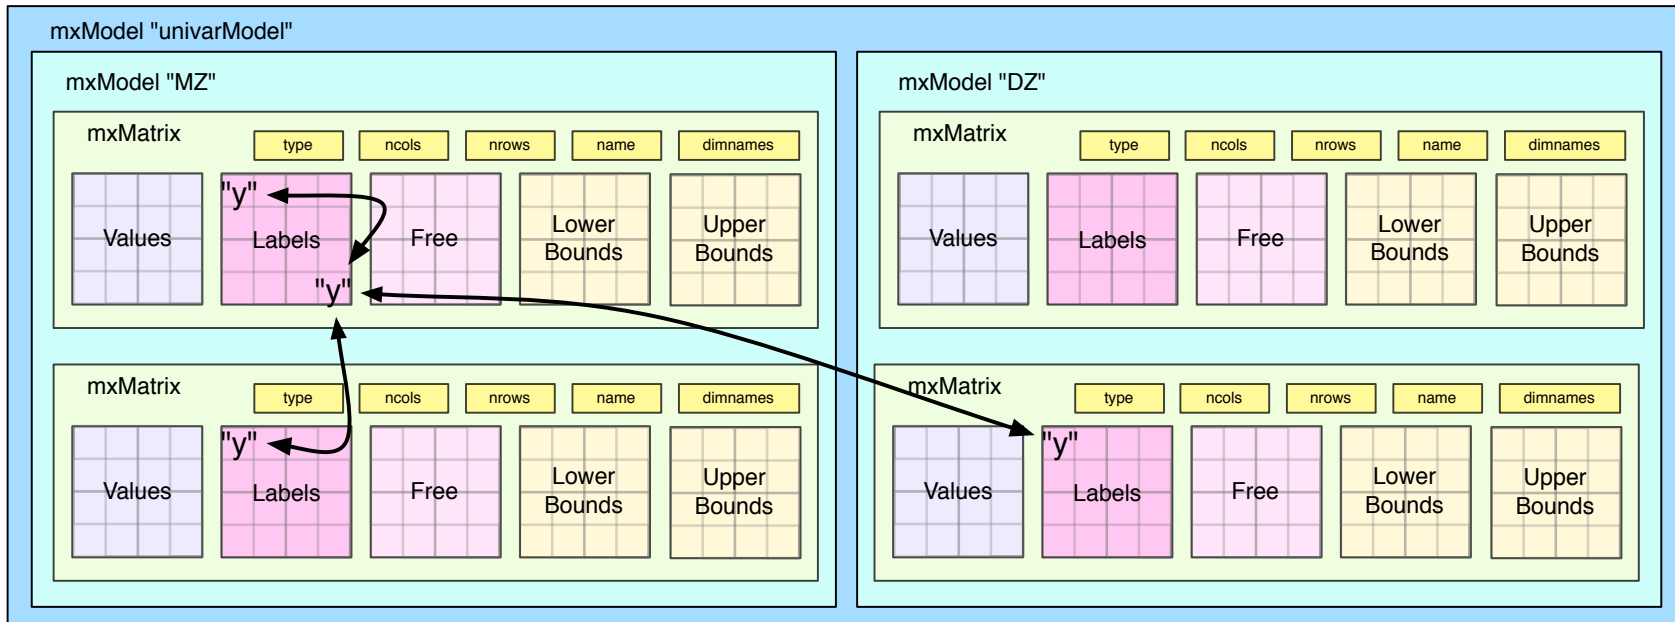

# Labels Can Constrain to Algebraic Results

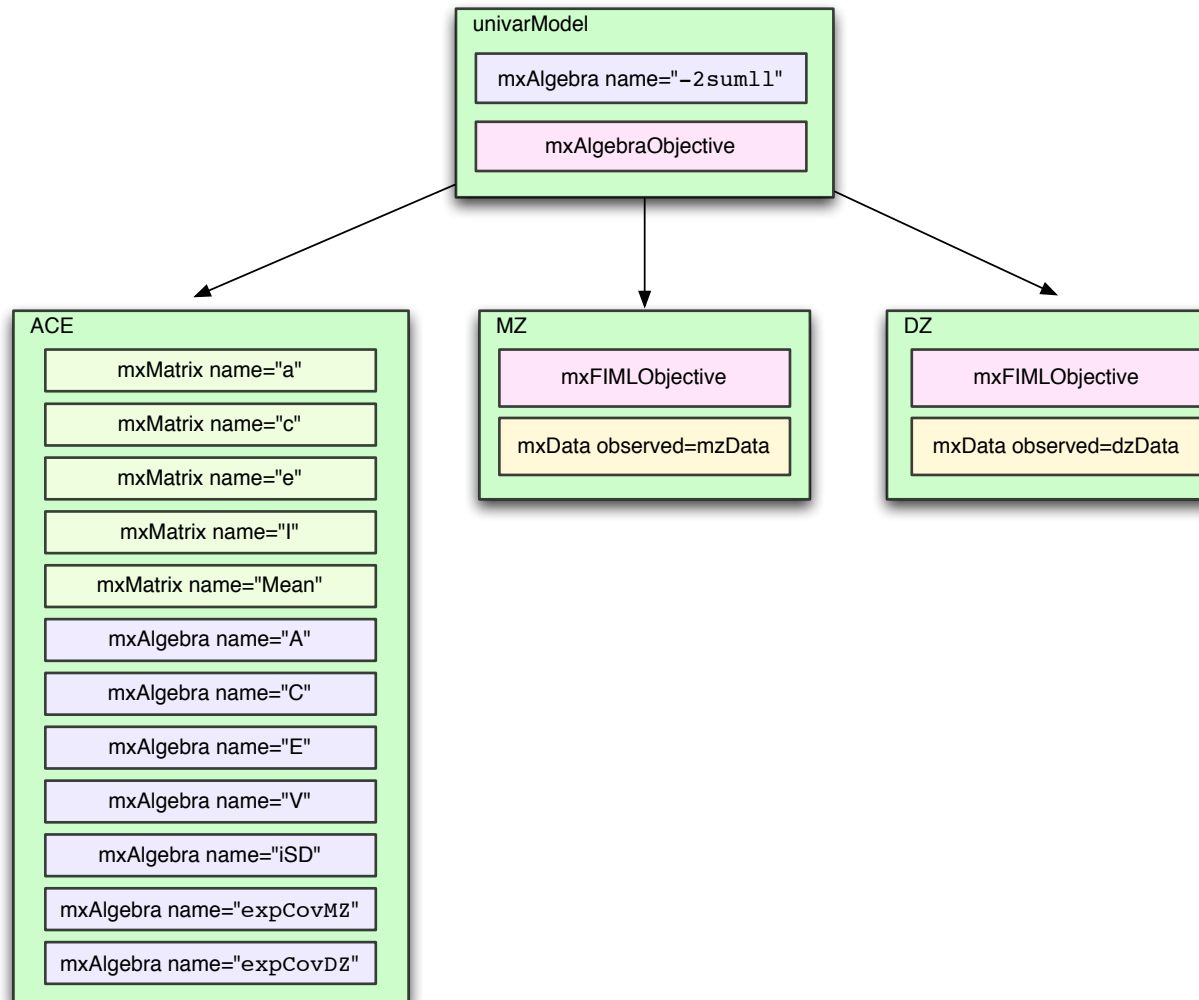

# Models Can Be Hierarchically Structured

# Equality Constraints between mxModels in a Hierarchy

# Structure of a Univariate ACE mxModel

# R & OpenMx General Usage

Case: **Sensitive sensitive SENSITIVE**

Comments: **#Anything to the right of # on a line**

Blank lines: are **ignored**

Keywords: gotta get them **spelled** and **camelCased** correctly!

# OpenMx Matrix Types

> ?mxMatrix

| Type   | Structure        | Shape  | Modifiable |
|--------|------------------|--------|------------|
| Zero   | Null (zeros)     | Any    | 0          |
| Unit   | Unit (ones)      | Any    | 0          |
| Iden   | Identity         | Square | 0          |
| Diag   | Diagonal         | Square | r          |
| S Diag | Subdiagonal      | Square | $r(r-1)/2$ |
| Stand  | Standardized     | Square | $r(r-1)/2$ |
| Symm   | Symmetric        | Square | $r(r+1)/2$ |
| Lower  | Lower triangular | Square | $r(r+1)/2$ |
| Full   | Full             | Any    | r x c      |

# Example Matrices I

| Example Command  | Free Matrix                       | Values                         |
|--|-----------------------------------|--------------------------------|
| <code>mxMatrix('Zero', 2, 3, free=T, name='A')</code>                  | <pre> 0 0 0 0 0 0 </pre>          | <pre> 0 0 0 0 0 0 </pre>       |
| <code>mxMatrix('Unit', 2, 3, free=T, name='B')</code>                  | <pre> 0 0 0 0 0 0 </pre>          | <pre> 1 1 1 1 1 1 </pre>       |
| <code>mxMatrix('Iden', 3, 3, free=T, name='C')</code>                  | <pre> 0 0 0 0 0 0 0 0 0 </pre>    | <pre> 1 0 0 0 1 0 0 0 1 </pre> |
| <code>mxMatrix('Diag', 3, 3, free=T, values=c(1,2,3), name='D')</code> | <pre> NA 0 0 0 NA 0 0 0 NA </pre> | <pre> 1 0 0 0 2 0 0 0 3 </pre> |

**NA** denotes that a parameter is free and is not constrained to equal any other parameters. It is effectively a *missing label* for that parameter.

# Example Matrices II

| Example Command  | Free Matrix                                      | Starting Values                            |
|--|--|--|
| <pre>mxMatrix('Sdiag', 3, 3,          free=T,          values=c(3,4,5,6,7,8),          name='E')</pre> | <pre>0 0 0 0 NA 0 0 0 NA NA 0 0 NA NA NA 0</pre> | <pre>0 0 0 0 3 0 0 0 4 6 0 0 5 7 8 0</pre> |
| <pre>mxMatrix('Stand', 3, 3,          free=T, values=          c(.6,.7,.8),name='B')</pre>             | <pre>0 0 0 NA 0 0 NA NA 0</pre>                  | <pre>1 6 7 6 1 8 7 8 1</pre>               |
| <pre>mxMatrix('Symm', 3, 3,          free=T, name='C')</pre>   | <pre>0 0 0 0 0 0 0 0 0</pre>                     | <pre>1 0 0 0 1 0 0 0 1</pre>               |
| <pre>mxMatrix('Lower', 3, 3,          free=T,          values=c(1,2,3,4,5,6),name='D')</pre>           | <pre>NA 0 0 NA NA 0 NA NA NA</pre>               | <pre>1 0 0 2 4 0 3 5 6</pre>               |

# Matrix Algebra

## >?mxAlgebra

```
A <- mxMatrix('Full', nrow = 3, ncol = 3, values=2, name = 'A')  
  
# Simple example: algebra B simply evaluates to the matrix A  
B <- mxAlgebra(A, name = 'B')  
  
# Compute A + B  
C <- mxAlgebra(A + B, name = 'C')  
  
# Compute sin(C)  
D <- mxAlgebra(sin(C), name = 'D')  
  
# Make a model and evaluate the mxAlgebra object 'D'  
A <- mxMatrix('Full', nrow = 3, ncol = 3, values=2, name = 'A')  
model <- mxModel('AlgebraExample', A, B, C, D )  
fit <- mxRun(model)  
mxEval(D, fit)
```

# Matrix Operators & Functions I

| Operator name                        | R name             | Conformability          | (Classic Mx name)            |
|--------------------------------------|--------------------|-------------------------|------------------------------|
| Square Bracket Operator (element)    | $A[x,y]$           | --                      | $\backslash\text{part}(A,B)$ |
| Square Bracket Operator (row or col) | $A[x,]$ or $A[,y]$ | --                      | --                           |
| Square Bracket Operator (subrange)   | $A[x:y, w:z]$      | --                      | $\backslash\text{part}(A,B)$ |
| Transpose                            | $t(A)$             | --                      | $A'$                         |
| Inversion                            | $\text{solve}(A)$  | $r=c$                   | $A\sim$                      |
| Element powering                     | $A \wedge B$       | --                      | --                           |
| Matrix multiplication                | $A \%*\% B$        | $c_A=r_b$               | $A * B$                      |
| Dot product                          | $A * B$            | $r_A=r_B$ and $c_A=c_B$ | $A . B$                      |
| Kronecker product                    | $A \%x\% B$        | --                      | $A @ B$                      |

# Matrix Operators & Functions II

| Operator name        | R name                | Conformability          | (Classic Mx name) |
|----------------------|-----------------------|-------------------------|-------------------|
| Kronecker exponent   | $A \%^\% B$           | --                      | $A \wedge B$      |
| Quadratic product    | $A \%&\% B$           | $C_A=r_B=C_B$           | $A \& B$          |
| Element division     | $A / B$               | $r_A=r_B$ and $C_A=C_B$ | $A \% B$          |
| Addition             | $A + B$               | $r_A=r_B$ and $C_A=C_B$ | $A + B$           |
| Subtraction (binary) | $A - B$               | $r_A=r_B$ and $C_A=C_B$ | $A - B$           |
| Subtraction (unary)  | $- A$                 | --                      | $- A$             |
| Horizontal adhesion  | $\text{cbind}(A,B,C)$ | $r_A=r_B$               | $A   B   C$       |
| Vertical adhesion    | $\text{rbind}(A,B,C)$ | $C_A=C_B$               | $A \_ B \_ C$     |

# Matrix Operators & Functions III
