Genome-wide association studies (GWAS)

Visscher et al. 2017. AJHG

Welcome to the Atlas of GWAS Summary Statistics

This atlas is a database of publicly available GWAS summary statistics. Each GWAS can be browsed with the manhattan plot, risk loci, MAGMA (i.e. gene-based) results, SNP heritability and genetic correlations with other GWAS in the database. 600 GWAS were performed in this project based on UK Biobank release 2 data under application ID 16406. Full summary statistics can be downloaded from the original source following the provided links.

If you have/find GWAS summary statistics that are publicly available and not included in this database, please let us know by contacting Kyoko Watanabe (k.watanabe@vu.nl).

Citation:

Watanabe, K. *et al.* A global view of pleiotropy and genetic architecture in complex traits. *bioRxiv* doi: <https://doi.org/10.1101/500090>

Currently the database contains **4,155** GWAS from **295** unique studies across **2,960** unique traits and **27** domains.

Browse GWAS

Overview of each GWAS such as Manhattan plots and QQ plot at SNP and gene levels and genetic correlations with other GWAS in the database.

[Browse GWAS](#)

Multiple GWAS comparison

Multiple GWAS can be compared in terms of genetic correlations, overlap of significant genes based on MAGMA gene-analysis and overlap of genetic risk loci.

[Multiple GWAS comparison](#)

PheWAS

PheWAS plot for a SNP or gene can be created across GWAS in the database.

[PheWAS](#)

What's new

2019-01-17

Second release of atlas database with in total of 4155 GWAS summary statistics (ID 3799-4155 are new GWASs). The last database curation was done in Oct 2018. Several updates have done for ID 1-3798 (see "DateLastModified" column in the database).

2018-12-20

Preprint is now available (doi: <https://doi.org/10.1101/500090>). The second release of the atlas database (total 4155 GWAS) will be available soon.

2018-09-28

First release of atlas database with 3798 GWAS summary statistics. The last database curation was done in Aug 2017. We will update summary statistics published since then, in near future. Publication is under preparation.

2017-12-18

First internal release of the website.

SNPs plots

Manhattan plot

For plotting, overlapping data points are not drawn (filtering was performed only for SNPs with P-value $\geq 1e-5$, see documentation for more details of filtering).

Download the plot as [PNG](#) [JPG](#) [SVG](#) [PDF](#)

Q-Q plot

For plotting purposes, overlapping data points are not drawn (filtering was performed only for SNPs with P-value $\geq 1e-5$, see documentation for details of filtering).

Top SNPs

Top SNPs are defined as the most significant SNP in a genomic risk locus. See documentation for details of definition of the genomic risk loci.

Download the table as [csv](#)

FAQ

Pleiotropic risk loci

Each dot represents a group of physically overlapping risk loci. See [Documentation](#) for details. The genome wide plot can be zoomed in and out by scroll. When Y-axis is the number of associated domains, the dots are sized by the number of associated GWAS and vice versa. Note that the number of associated GWAS is the number of associated unique summary statistics which does not necessary reflect the number of associated unique traits when multiple summary statistics for a single trait are selected. By clicking a dot, another plot for a specific group of risk loci will be plotted (only if the number of GWAS in the grouped locus is > 1). Note that P-value < 1e-300 is replaced with 1e-300 (maximum -log10 P-value is 300 in this plot).

FUMA GWAS

Functional Mapping and Annotation of Genome-Wide Association Studies

FUMA is a platform that can be used to annotate, prioritize, visualize and interpret GWAS results.

The [SNP2GENE](#) function takes GWAS summary statistics as an input, and provides extensive functional annotation for all SNPs in genomic areas identified by lead SNPs.

The [GENE2FUNC](#) function takes a list of gene IDs (as identified by SNP2GENE or as provided manually) and annotates genes in biological context

To submit your own GWAS, login is required for security reason. If you have't registered yet, you can do from [here](#).

You can browse example results of FUMA for a few GWAS from [Browse Examples](#) without registration or login.

Please post any questions, suggestions and bug reports on Google Forum: [FUMA GWAS users](#).

Citation:

When using FUMA, please cite the following.

K. Watanabe, E. Taskesen, A. van Bochoven and D. Posthuma. Functional mapping and annotation of genetic associations with FUMA. *Nat. Commun.* 8:1826. (2017).

<https://www.nature.com/articles/s41467-017-01261-5>

Depending on which results you are going to report, please also cite the original study of data sources/tools used in FUMA (references are available at [Links](#)).

Further filtering of SNPs based on functional annotations prior to gene mapping

CADD score (>12.37 is considered as highly deleterious)

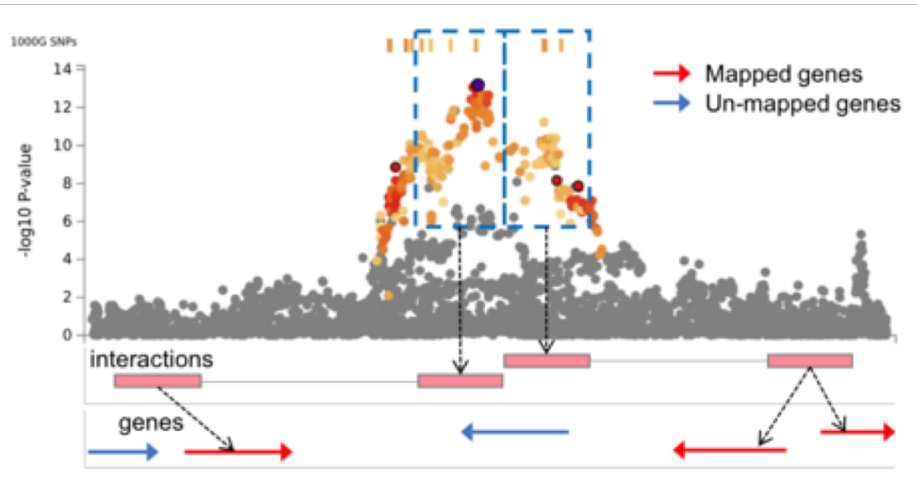

RegulomeDB score (categorical score from 1a to 7)

15-core chromatin status (1-7 states are considered as open, tissue specific)

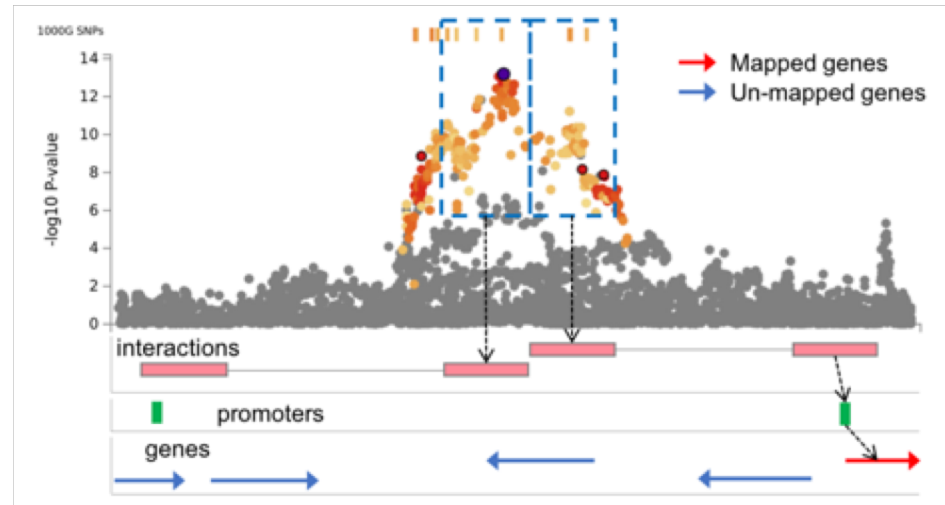

*Parameters can be set for each mapping separately

Gene mapping

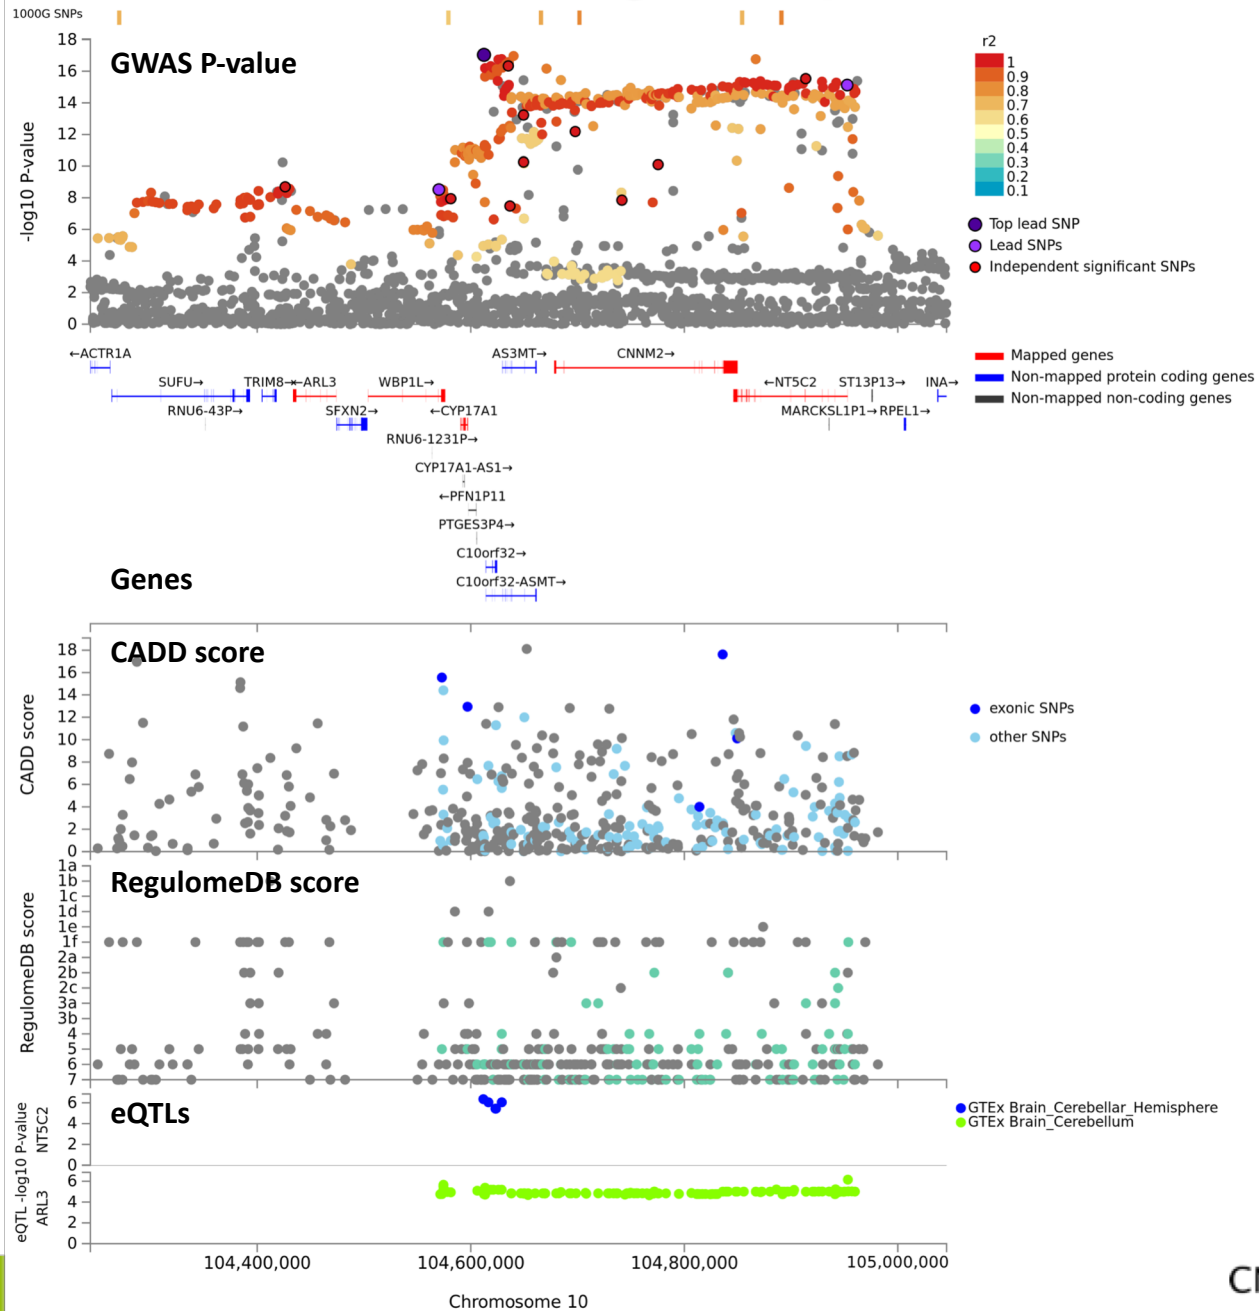

Chromatin interaction mapping

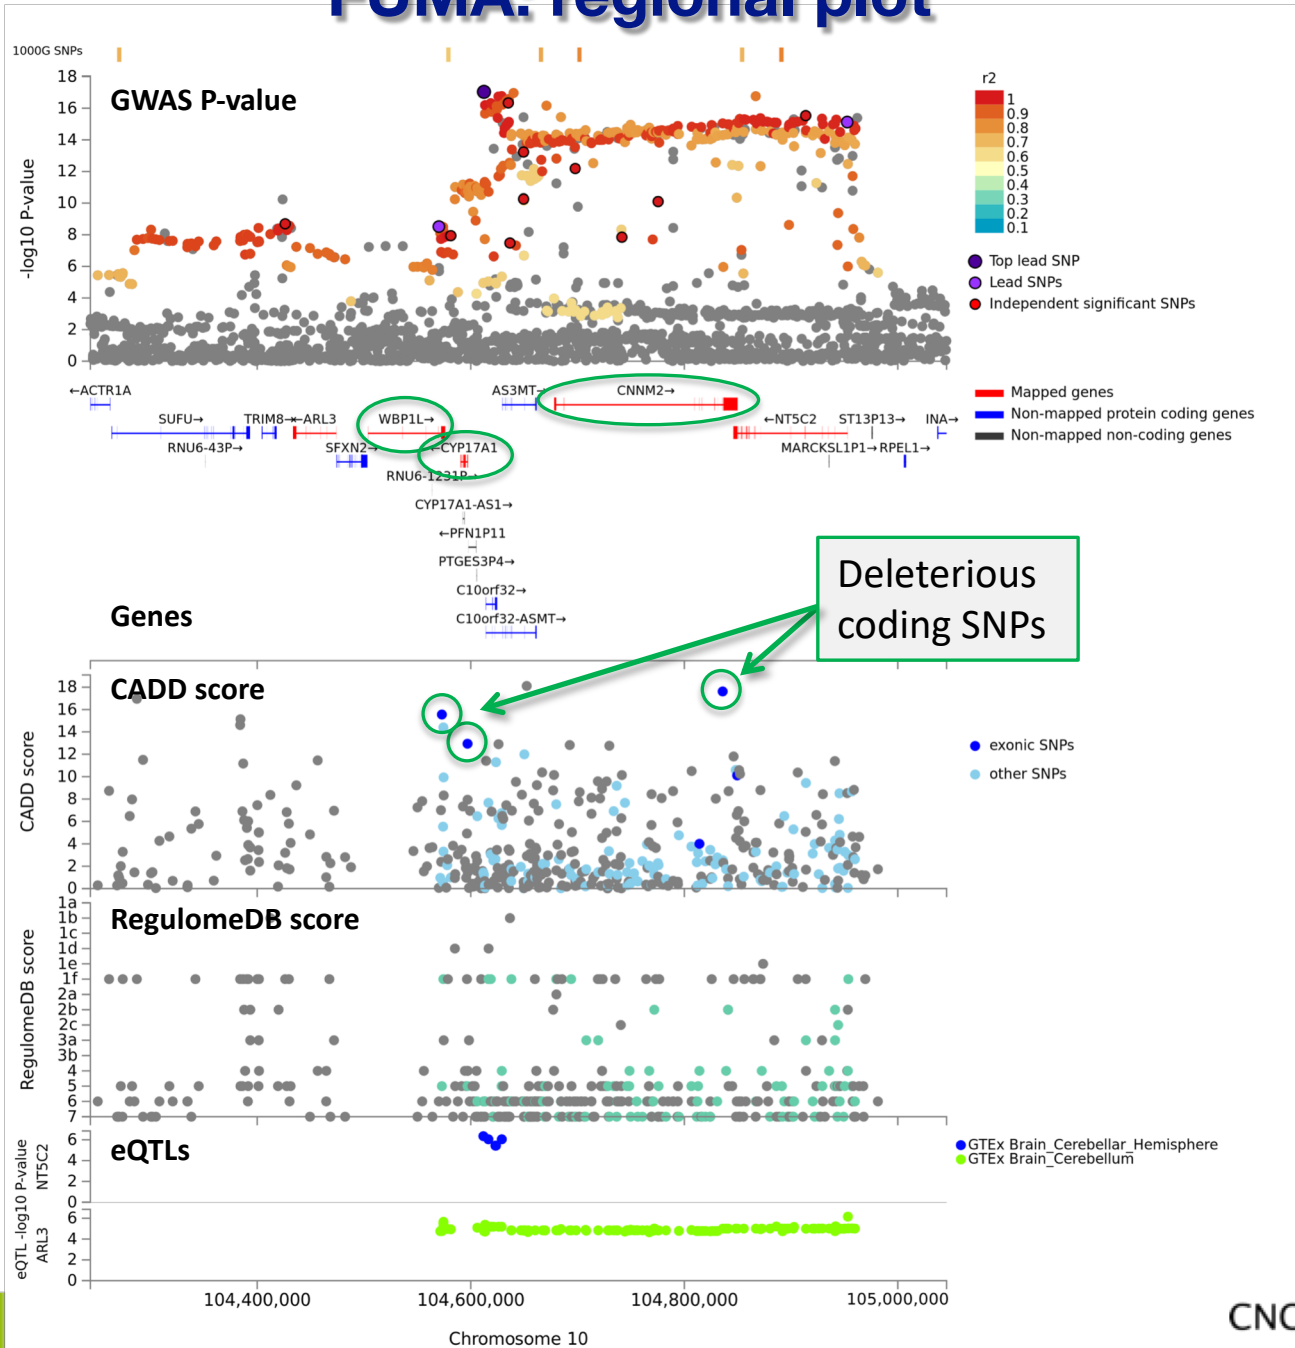

Map SNPs in a genomic region interacting with promoter region of genes (250bp up- and 500bp downstream of TSS) in selected tissue types. In addition to functional annotations, SNPs can be further filtered on such that overlap with predicted enhancers from Roadmap. Mapping can be limited to genes whose promoter regions are overlapping with predicted promoters from Roadmap.

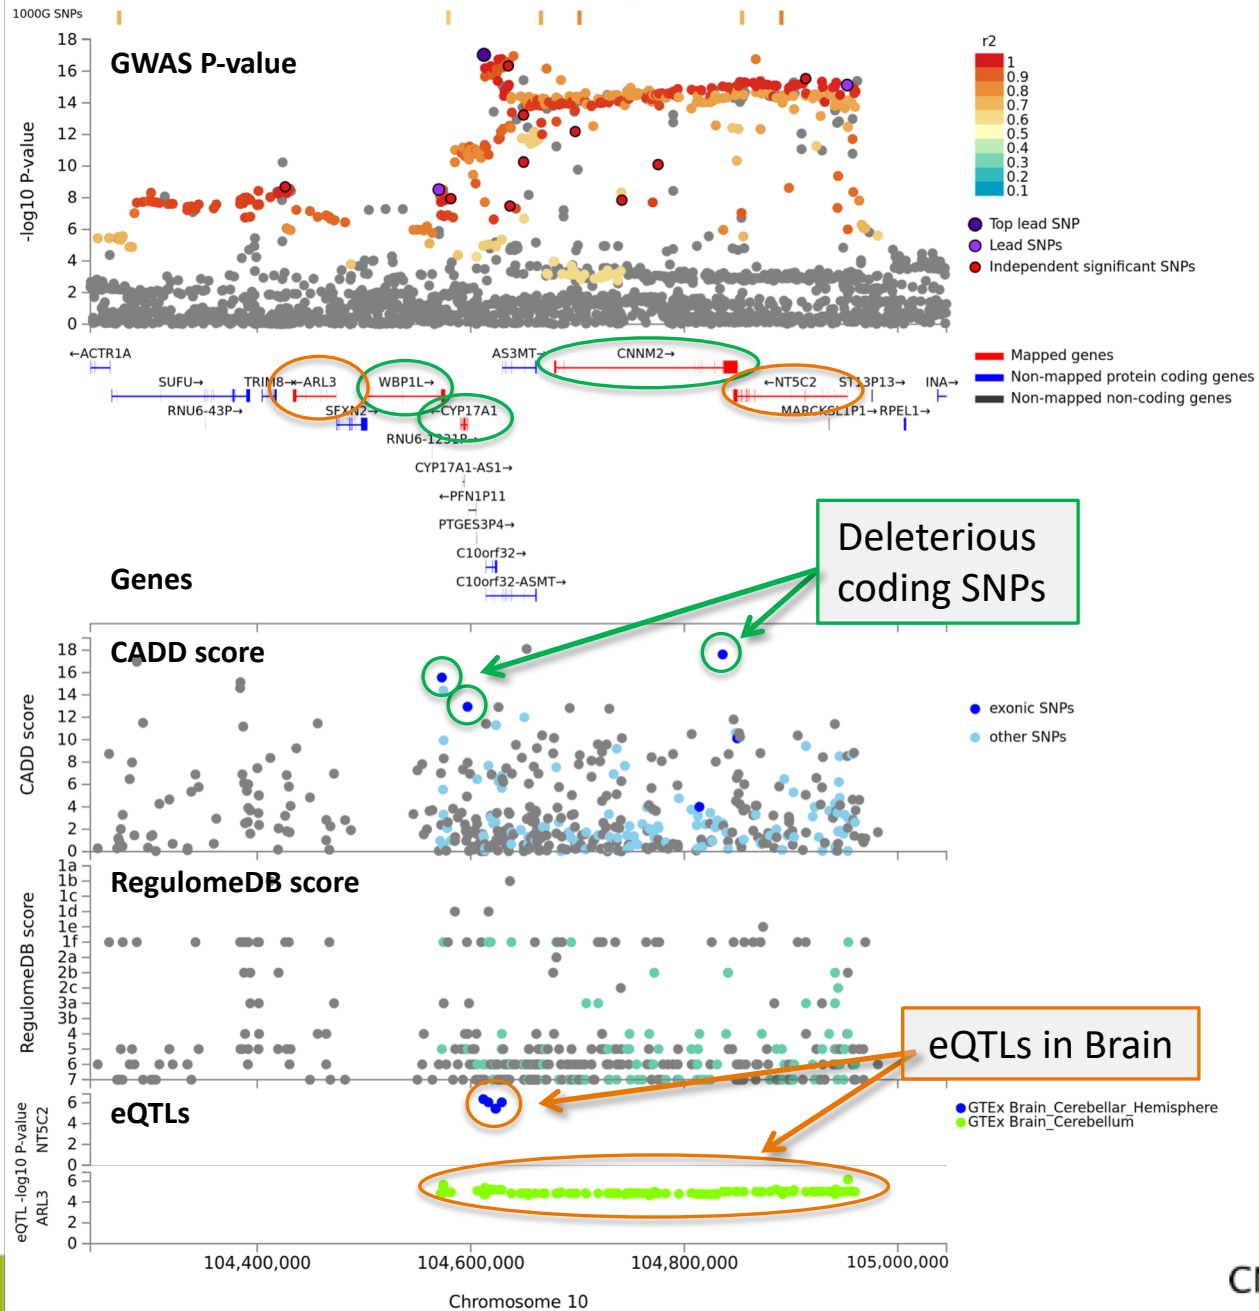

FUMA: regional plot

FUMA: regional plot

FUMA: regional plot

FUMA: circos plot

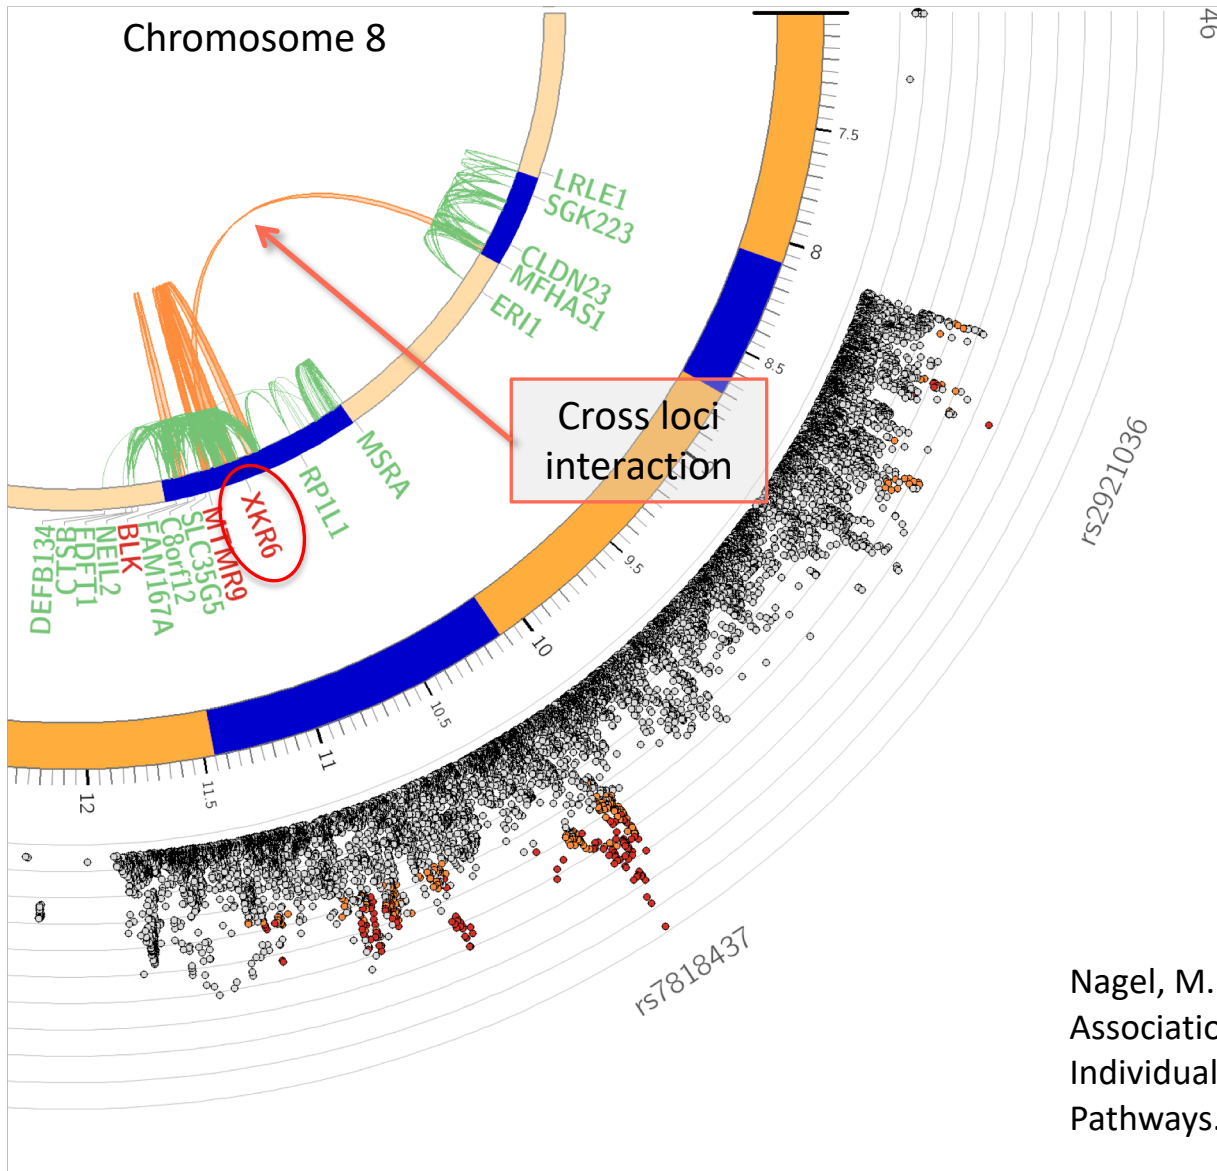

Chromatin interactions can map SNPs to distal genes.

Nagel, M. et al. Meta-Analysis of Genome-wide Association Studies for Neuroticism in 449,484 Individuals Identifies Novel Genetic Loci and Pathways. (2018) *Nat. Genet.*

FUMA: circos plot

Chromatin interactions can map SNPs to distal genes.

XKR6 is mapped by within and cross loci interactions, also mapped by eQTLs.

SNP2GENE: FAQ

- ✓ FUMA provides annotations for SNPs which are in LD with one of the independent significant SNPs which can help you prioritize likely interesting (functional) SNPs and genes in a locus but does not pinpoint the actual causal SNPs/genes
- ✓ GWAS P-value is used only to identify indep. sig./lead SNPs and candidate SNPs but not used to weight/score SNPs or genes
- ✓ For eQTL mapping, significant eQTLs are annotated to SNPs in loci but they are not colocalized (meaning there might be overlap of SNPs and eQTLs due to LD)
- ✓ MAGMA process is independent from main SNP2GENE process, gene mapping does not use MAGMA gene-based results
- ✓ Input SNPs need to be present in the reference panel FUMA uses. If you find missing SNPs, it's most likely because those SNPs does not exist in the selected reference panel or mismatch of alleles

GENE2FUNC

Interactive heatmap of gene expression

Tissue specificity (DEG)

Overrepresentation in Gene Sets

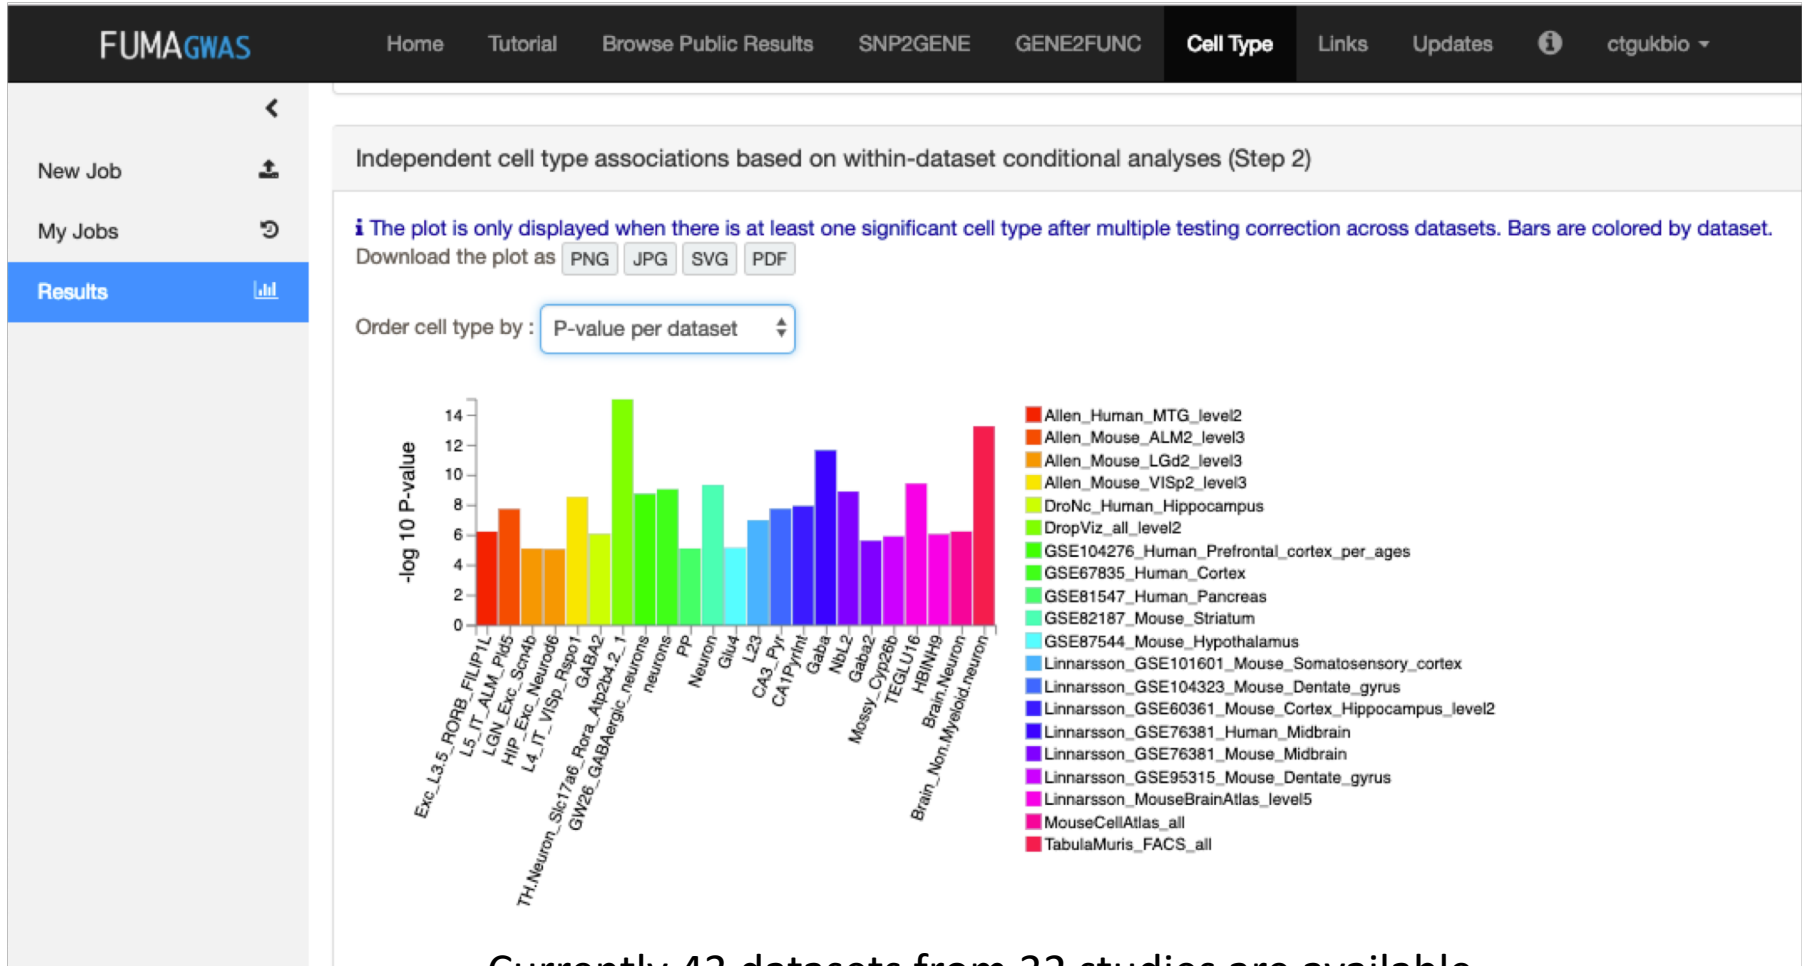

Curated gene sets
Motif gene sets
GO terms gene sets
(Total 20 categories)

General biological functions of genes

OMIM (known disease associations), DrugBank (known targets of drugs), GeneCards (general biological information)

Cell type specificity analysis

Currently 43 datasets from 32 studies are available

Technical information on FUMA

- ✓ You are required to register to submit a job
- ✓ Normally, SNP2GENE process takes 15-45 mins (depending on the number of hits and parameters, might take >1 hour)
- ✓ There are 5 parallel processes on FUMA server, your job might queue when the server is busy (average 45 jobs per day)
- ✓ Your input file(s) will be deleted from the server once the process is done
- ✓ When you get error and don't know how to solve
Google group: <https://groups.google.com/forum/#!forum/fuma-gwas-users>
Send me email: k.watanabe@vu.nl
*Please do not delete your job when you contact about an error of a specific job!

Practical

Copy and open /faculty/kyoko/2019/FUMA/fuma_practical.pdf

The practical is based on the online web application. Please use **Chrome** if possible (some javascript functions do not work well with IE).

Section 1: FUMA (<http://fuma.ctglab.nl>)

- ✓ Explore FUMA web application with example GWAS results
- ✓ Detail look into SNP2GENE results
- ✓ Prioritize genes based on SNP annotations for an example locus

***You are more than welcome to submit job during the workshop but the queue is currently shutdown, it will re-start after the session.**

Section 2: GWAS ATLAS (<http://atlas.ctglab.nl>)

- ✓ Quick tour of the website
- ✓ Comparison of multiple GWASs
- ✓ Create PheWAS plot
